## Optimum Security and Protection of Your Management Data

Given the speed and growth of information sharing through the interconnection of different IT application software programs, rigorous information management has become a crucial part of your office's day-to-day activities.

Just think of the recent blunders made by a well-known financial institution to grasp the full impact that a breach can have on the protection of your sensitive information.

That is why Progent has taken the protection of your information very seriously for many years. More specifically, Progent's application platform includes the following high-tech functionalities:

- ▶ Advanced management of functional and information security.
- ▶ "Who? When? What? Where?" traceability of the information entered.
- ▶ Integrity of the financial information entered.
- ▶ Controlled connectivity for interconnecting with complementary external applications.

Described in this way, these four technical features may not seem critical or important to you. But here are some more specific examples of how your data are protected:

- ▶ Protection of your patients' confidential information and your professional information.
- ▶ Protection against internal financial theft and fraud.
- ▶ Demonstration of the legal validity of your "paperless" computerized files.
- ▶ Protection against data corruption by an external third party whom you have given technical access to your management information.
- ▶ Protection against unauthorized data use by an external third party whom you have given technical access for a specific purpose.

At first glance, all software products may seem equal when it comes to protecting data. However, keep in mind that the degree of precision in the protection provided by the software product can make all the difference in one of these situations. In other words, it is all in the details.

In addition to these fundamental features offered by Progent's software products, there are of course certain basic mechanisms that you would be wise to install in your dental office:

- ▶ Effectively structured backup copies made at an appropriate frequency.
- ▶ Appropriate network access security coverage for your software programs that manage sensitive information.
- ▶ Information sharing with other parties through secure communication channels.

Progent guarantees that you have an ideal environment for protecting your management information. Feel free to contact one of our advisors to discuss this feature.
