New Application Interface and Management Improvements for the 2019 JDIQ

Once again this year, Progent/Clinic management improvements and technologies will be presented in conjunction with the upcoming Journées dentaires internationales du Québec (JDIQ).

Some of them include:

- ▶ A batch recall functionality (several recalls made in one single batch) lets you rapidly send follow-up communications to a pre-selected target clientele based on your management and communication criteria.
- ▶ A new software interface layer now makes each window fully independent in terms of its positioning. This improvement offers maximum potential for configuring equipment in the operatory or reception.

For instance, if you work with three screens connected to one work station, you can display your schedule

on the first screen, the patient file on the second, and the dental chart on the third.

Fully integrated into the “working environment” concept, this improvement gives you a complete overview of the patient file at a glance so that you can edit and adjust all information directly in the file.

With this new possibility, you can easily enhance your working environment according to the equipment set up in it.

Using the software on a single screen is of course still an option.

The professional annotation function also has new improvements; including the following:

- ▶ You can sign a professional note immediately when it is created with the assistant. This approach eliminates a step whenever it is unnecessary to review your basic text.
- ▶ You can manually link a professional note to an appointment. This new feature is useful when you think of additional information that you would like to link to a specific appointment or an appointment history.
- ▶ You can rapidly filter notes for a given professional for analytical purposes.

The software handles digital signatures by professionals on various routine documents: personalized texts, treatment plans, insurance forms, etc. Although optional, this approach can be used to accelerate document preparation and distribution to patients. This enhancement also makes it possible to integrate the professional's digital signature with other personalized documents.

A new billing correction management interface (credits and corrections) enhances the existing functionalities. Date, term, tooth, procedure or resource changes are much easier to make now, which speeds up your everyday administrative tasks.

Now that the Microsoft Office™ 365 platform is easier to manage, you enjoy a greater flow and better digital document integration.

Combined with a new interface layer, the latest version now offers you a list of refined display themes so that you can customize your working environment even more. These include the introduction of a series of display themes with a dark background.
